 A process for reclaiming polyvinylchloride (PVC) waste involves dissolving
 the waste in a solvent and removing insolubles to give a PVC solution. The
 obtd. PVC solution is mixed with a non-aqueous depositing medium which is
 compatible with the plasticisers. The PVC is coloured rigid PVC. The
 solvent is tetrahydrofuran (THF). The depositing medium is methanol,
 ethanol or n-hexane.
 USE - For reclaiming highly coloured and smudged PVC.
 ADVANTAGE - The process provides highly decoloured PVC.
